# Sales Performance & Revenue Growth Dashboard

Project Summary | Microsoft Power BI

This project uses Microsoft Power BI to turn sales data into an interactive business performance dashboard. It combines data preparation, data modeling, DAX measures, KPI cards, charts, matrices, and slicers to help users evaluate revenue, profitability, target achievement, and growth trends.

## Project at a Glance

| | | | |
|---|---|---|---|
| **Tool** | Microsoft Power BI Desktop | **Techniques** | Power Query, DAX, data modeling |
| **Focus** | Sales, revenue, profit, targets, growth | **Interaction** | Region, category, channel, executive, date filters |

## Dashboard Highlights

| Total Revenue | Total Profit | Units Sold | Target Achievement |
|---|---|---|---|
| **$47.00M** | **$17.32M** | **21K** | **102.35%** |

The current dashboard displays currency values with the $ symbol. This summary mirrors that display; the symbol alone does not confirm that the underlying data has been converted to US dollars.

## Key Business Insights

• **Regional performance:** South is the leading revenue region, with West close behind. East is the lowest-revenue region and is a candidate for further investigation.

• **Product profitability:** Office Supplies contributes the highest total profit among the product categories shown.

• **Sales targets:** Overall achievement is 102.35%, meaning actual sales are above the combined target.

• **Trends over time:** Monthly revenue and profit charts make it possible to identify peaks, declines, and periods that warrant further analysis.

• **Sales channels:** Online contributes more revenue than Offline in the current dataset, while target achievement should also be compared before deciding where to invest.

• **Growth priorities:** Investigate the East region, review lower-profit categories, learn from high-performing regions and channels, and monitor target achievement over time.

## Power BI Features Demonstrated

• Data cleaning and transformation with Power Query

• Date/calendar table and relationship-based data model

• DAX measures for revenue, profit, units sold, margins, target variance, MoM growth, and YoY growth

• KPI cards, line charts, bar charts, and performance matrices

• Interactive slicers for region, product category, sales channel, sales executive, and date

## Conclusion

The dashboard provides a consolidated view of sales performance and helps stakeholders track KPIs, compare regions and categories, evaluate target achievement, and identify opportunities to improve revenue and profitability. It demonstrates practical Power BI skills in data preparation, modeling, DAX, visualization, and business interpretation.

Project note: Validate currency units and percentage formatting before publishing or presenting the dashboard.
